

Rever for controllers, in two pages

Published 12 October 2026

The controller's brief

Rever is agentic AI finance automation, built by finance, for finance. Eve, your agentic finance manager, coordinates fifteen specialist agents in five groups on the ledger you already run: they recover value, verify transactions, keep the books and the close moving, improve cash visibility and evidence, and keep the agent team accountable. Agents prepare the work, and your team approves every financial action.

How it fits together

Your systems. Read-only connections to NetSuite, Dynamics 365, QuickBooks, Stripe, your banks and your documents. Your source data stays unchanged.

Mapping Studio and Eve. Mapping Studio maps your ERP tables and data into Rever's record. Eve builds the business profile and drafts the SOPs your process owners confirm. Materiality and approval paths live in Settings.

The zero-day scan. The first pass over your connected records once read-only access is in place. It reveals initial findings with the evidence behind them and leaves missing sources visible. In a free Proof of Value it runs on a limited period of your data.

Eve and the agents. Every human action lands in the Inbox, linked to its finding with the evidence attached. Eve sequences it by materiality. She cannot post journals or move money.

Every month after. Matcher and Spend Guard work before the AP run, Close Orchestrator, Journal and Flux Analyst carry the month, and Evidence and Auditor have the file ready when fieldwork begins.

What Rever reports

Five outcomes, tracked apart: value identified, value recovered, leakage prevented, cash released and errors corrected. The honesty ratio, value recovered divided by value found, keeps identified and recovered apart.

What a controller should check

You keep the pen. Rever never writes to your systems and only approved work leaves it, Journal cannot approve its own entry, and you set the approval thresholds and dual approval for material amounts. Sentinel flags suspicious vendor-bank changes and prepares an independent callback to a trusted contact.

The close stays ready. Close Orchestrator keeps tasks and sign-offs moving all month and will not certify an incomplete close, while Journal prepares each entry with its support.

The agents are tested. Auditor reperforms matches and states untested coverage. Steward turns a stale bank feed into a health item.

The auditor finds the support attached. Evidence links every entry to its documents.

IT and the ERP admin. IT gets SOC 2 Type II, ISO/IEC 27001:2022 and no training on customer data, on managed cloud or, on Enterprise, self-host or private cloud. The security pack comes on request.

Pricing shape. Free covers the zero-day scan, self-serve, and Eve on the scanned data. Growth and Enterprise are priced after the Proof of Value, on scope rather than seats.

The first step

A zero-day scan on a limited period of your own data, in a free Proof of Value: a short call, an agreed scope, a read-only connection, the scan and a walkthrough. The [guide for controllers](#) covers each step, and [the controller's case](#) covers what stays on your desk.
